

Measuret from 16 digital multimeters in a single device **16ch isolated, full simultaneous sampling**

Multi-channel measurements, no scanner required

Simultaneous sampling across all channels High-speed/high-precision measurement without a scanner

Uniform data management

The MR8741/MR8740 can save data from 16 digital multimeters at once

Useful as a powerful high-speed/high-precision data logger

Observe changes using waveforms and area judgment

Monitor voltage waveforms and set thresholds for pass/fail evaluations

High-resolution 6 ¹/2-digit display

Max resolution of 0.1 $\mu\text{V},$ covering micro-voltage changes in sensors and other devices

Extended applications

Eight interchangeable modules available Simultaneously record temperature, distortion, logic, etc.

Save space and power

Modular design uses smaller overall footprint and wiring is simple - all you need is one power cord and one LAN cable for PC control. Maximum power consumption is 120 VA, even at 16ch.

DIGITAL VOLTAGE METER

DVM UNIT MR8990: the heart of the system

±0.01% precision and 0.1 µV resolution

New module for DMM STATION MR8741/8740

The DVM UNIT MR8990 is a 2-channel V DC measurement module for the MR8741/8740. It can measure minute fluctuations in output from sensors in automobiles and other equipment, as well as voltage fluctuations in devices such as batteries, at high levels of precision and resolution.

High precision: ±0.01% rdg. ±0.0025% f.s.

High precision measurement is delivered even at 500 samples/sec

• High resolution: 6 1/2-digit display (0.1 µV resolution), 24-bit Even minute fluctuations in the output voltage of sensors and other equipment can be measured. Max 1200000 counts

Max. allowable input: DC 500 V

All input channels are individually isolated

High input resistance

7.8 kg (275.1 oz)

100 mV range to 10 V range: More than 100 $M\Omega$ 100 V range to 1000 V range: 10 MΩ±5%

Specifications (Product quality and accuracy guaranteed for one year)

Options for MR8990 TEST LEAD L2200 One set (Red \times 1, Black \times 1) , 70 cm (2.30 ft) length Unit jack: Banana terminal

Pin leads and alligator clips Replaceable clips Max. allowable input: CAT IV 600 V, CAT III 1000 V

The MR8990 cannot measure AC voltage, current, or resistance. Select from other modules for a variety of measurement options

The number of power line cycles (NPLC), which indicates the number of cycles in the power supply's period (50 Hz or 60 Hz), determines the integration time. Larger NPLC values result in more effective rejection of noise caused by the power supply at the expense of lower sampling speeds.

(f.s. = measurement range)

Fully isolated 16ch simultaneous sampling

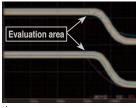

All 16 channels can be sampled at the same time. There's none of the time lag that appears when using a scanner to switch between multiple measurement devices, providing you **full simultaneous sampling**. Make completely accurate measurements without misalignment in start times or between channels. Inputs are also isolated for all channels.

Plug-in module design

Inputs are user-exchangeable plug-in modules. By combining different modules, it is possible to measure temperature, logic signals and other data types along with DC voltage. Current can also be measured by using a clamp-on AC/DC sensor (Hioki CT9690 series).

Area-based evaluation

Define a detection area to evaluate the shape of measured waveforms. This is useful for battery-discharge and power supply durability testing. The instrument's real-time* evaluation capability also allows it to be used for constant monitoring. Evaluation

results can also be output to external device.

(*) In slow ranges (time axis range: 100 ms/div or less)

Waveform calculation functions

Wave calculations can be applied to measured waveforms. This is useful for checking changes in potential differences between battery cells (cell 1 - cell 2) or DC power (voltage × current). Up to 16 calculations can be defined simultaneously for any given channel. 10 function types are available, in addition to arithmetic operations.

Numerical calculation functions

Numerical calculations can be performed on all measurement data or on a subset of the measurement data. A total of 24 calculations, including interval-specific maximum, minimum, and average values, can be performed using data measured at high precision with the DVM unit on user-specified channels, and up to 16 calculations can be performed simultaneously. Upper/lower limit can also be defined for calculation results, allowing for value-based evaluation.

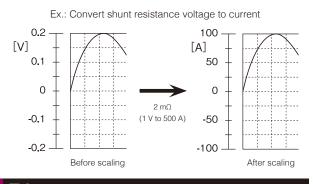

All channels displayed as waveforms

The MR8741 can generate time plots depicting all channels on the same time axis, and it can measure waveform levels over extended periods of time. Values are displayed on the connected display or PC screen. You can also switch between waveform and value display during measurement.

Scaling functions

Voltage output from sensors and other equipment can be converted into actual physical quantities for measurement and display.

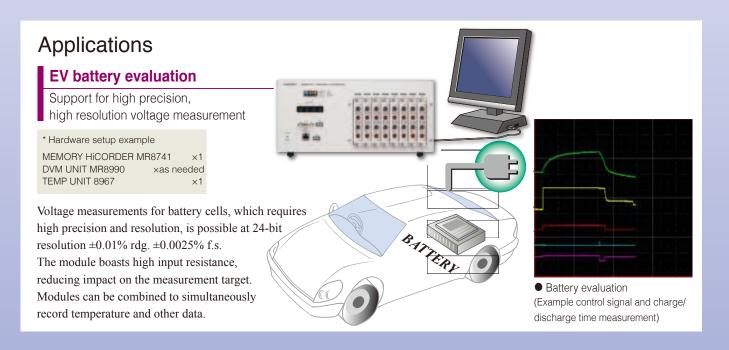

Triggers

Triggers can be applied based on signals input from an external source, logic, or other means, and the voltage value at the point of trigger application can be measured at a high degree of precision with the MR8990. The pre-trigger function can be used to observe data leading up to the

trigger. In addition, modules other than the MR8990 provide a variety of triggers, including level triggers.
